In the Specification:

Kindly replace the paragraph on page 24, beginning at line 16 and extending onto page 25, line 3 with the following:

Referring to Fig. 9, Unprotect data Functional Block [[50]] 60 of Fig. 2 is now described. Preferably, this event occurs at the Remote System 18. A purpose of this step is to stop the preferred EMC Snapview Snap sessions that were used to hold the consistent data. This can be used for cleanup or during the normal processing of an update. In steps 120 and 122, the use case begins at the Remote location when an administrative request is received from the Production Site 11. In step 124, the administrative request contains enough information to stop the preferred Snap session(s) to unprotect the consistent data image at the remote site. In step 126, an acknowledgement is sent back to the Production Site 11. The acknowledgment indicates the result of the stop of the snap sessions(s) in step 128 and the use case ends.
